BidMart Auth API

Identity and session service in Rust

RUST AXUM POSTGRESQL

THE IDEA

A structured service for secure account access.

Agency collaborator: shiowoneko

PROJECT BRIEF / 06

BidMart Auth API

WHAT THE PROJECT DOES

A structured service for secure account access.

THE PROBLEM

Authentication requires more than login: verification, MFA, password recovery and session revocation must work as one coherent system.

CREDIT / ROLE

shiowoneko. Agency collaborator project; exact module contribution was not specified.

Repository snapshot 6f27021

SOLUTION & STACK / 06

BidMart Auth API

HOW IT WORKS

The Rust/Axum service separates API handlers, use cases and persistence. It provides email verification, MFA, token or cookie authentication, and settings endpoints.

FEATURES

- Registration and email verification
- TOTP/email MFA
- Session and password management

TECH STACK

Rust / Axum / PostgreSQL

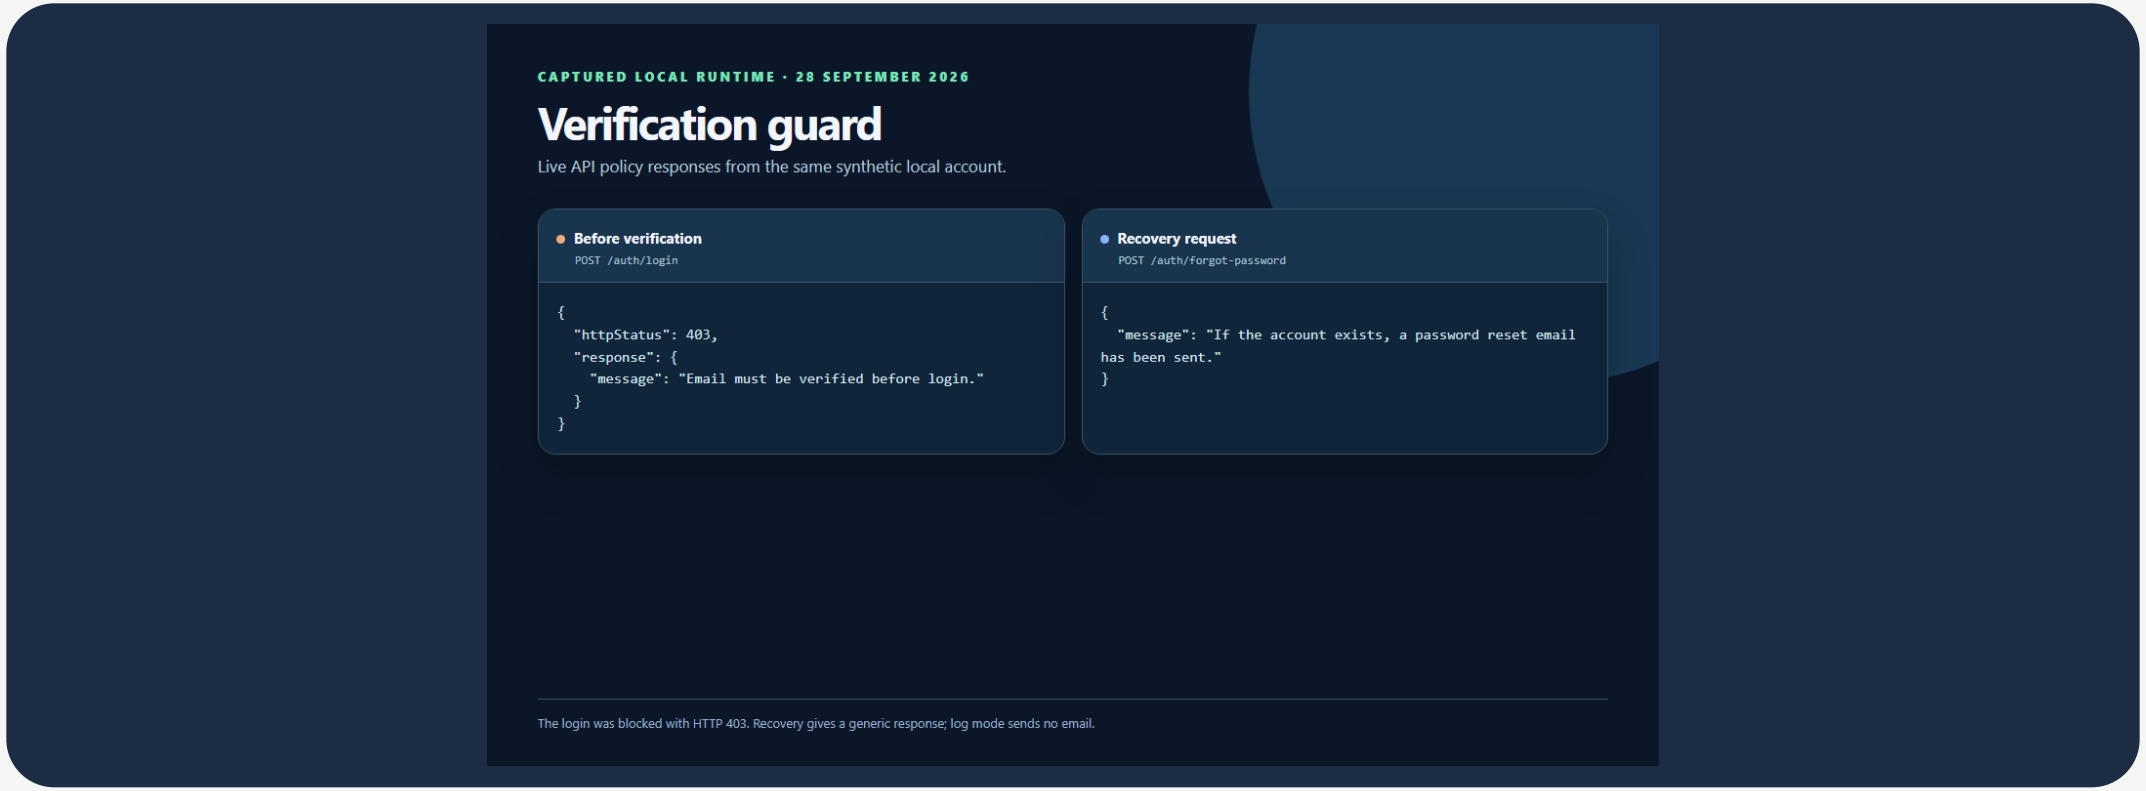

BidMart Auth API

Live health, readiness and registration

BidMart Auth API

VERIFIED OUTCOME

The application passed cargo check and launched with local PostgreSQL 17. Health and readiness checks passed; synthetic registration returned 201, login before verification returned 403, and recovery returned a generic response in email log mode. The existing Rust unit-test target still has 24 compile errors.

LOCAL CHECK

RUN: PostgreSQL-backed API, health, readiness, registration and policy responses verified locally. cargo test --lib has 24 compile errors.
