ProtoMorph-DINO

An experimental head for hard-case image classification

PYTORCH DINOV3 COMPUTER VISION

THE IDEA

Route difficult images through a refinement branch.

Agency collaborator: shiowoneko

PROJECT BRIEF / 07

ProtoMorph-DINO

WHAT THE PROJECT DOES

Route difficult images through a refinement branch.

THE PROBLEM

A frozen vision backbone can be efficient, but ambiguous images may need extra refinement beyond a simple classifier head.

CREDIT / ROLE

shiowoneko. Agency collaborator project; exact module contribution was not specified.

Repository snapshot 63089c1

SOLUTION & STACK / 07

ProtoMorph-DINO

HOW IT WORKS

The proposed architecture takes DINOv3 patch features through prototype blocks and memory attention. A hard-case gate can invoke a feedback-modulated Delta-RBF expert.

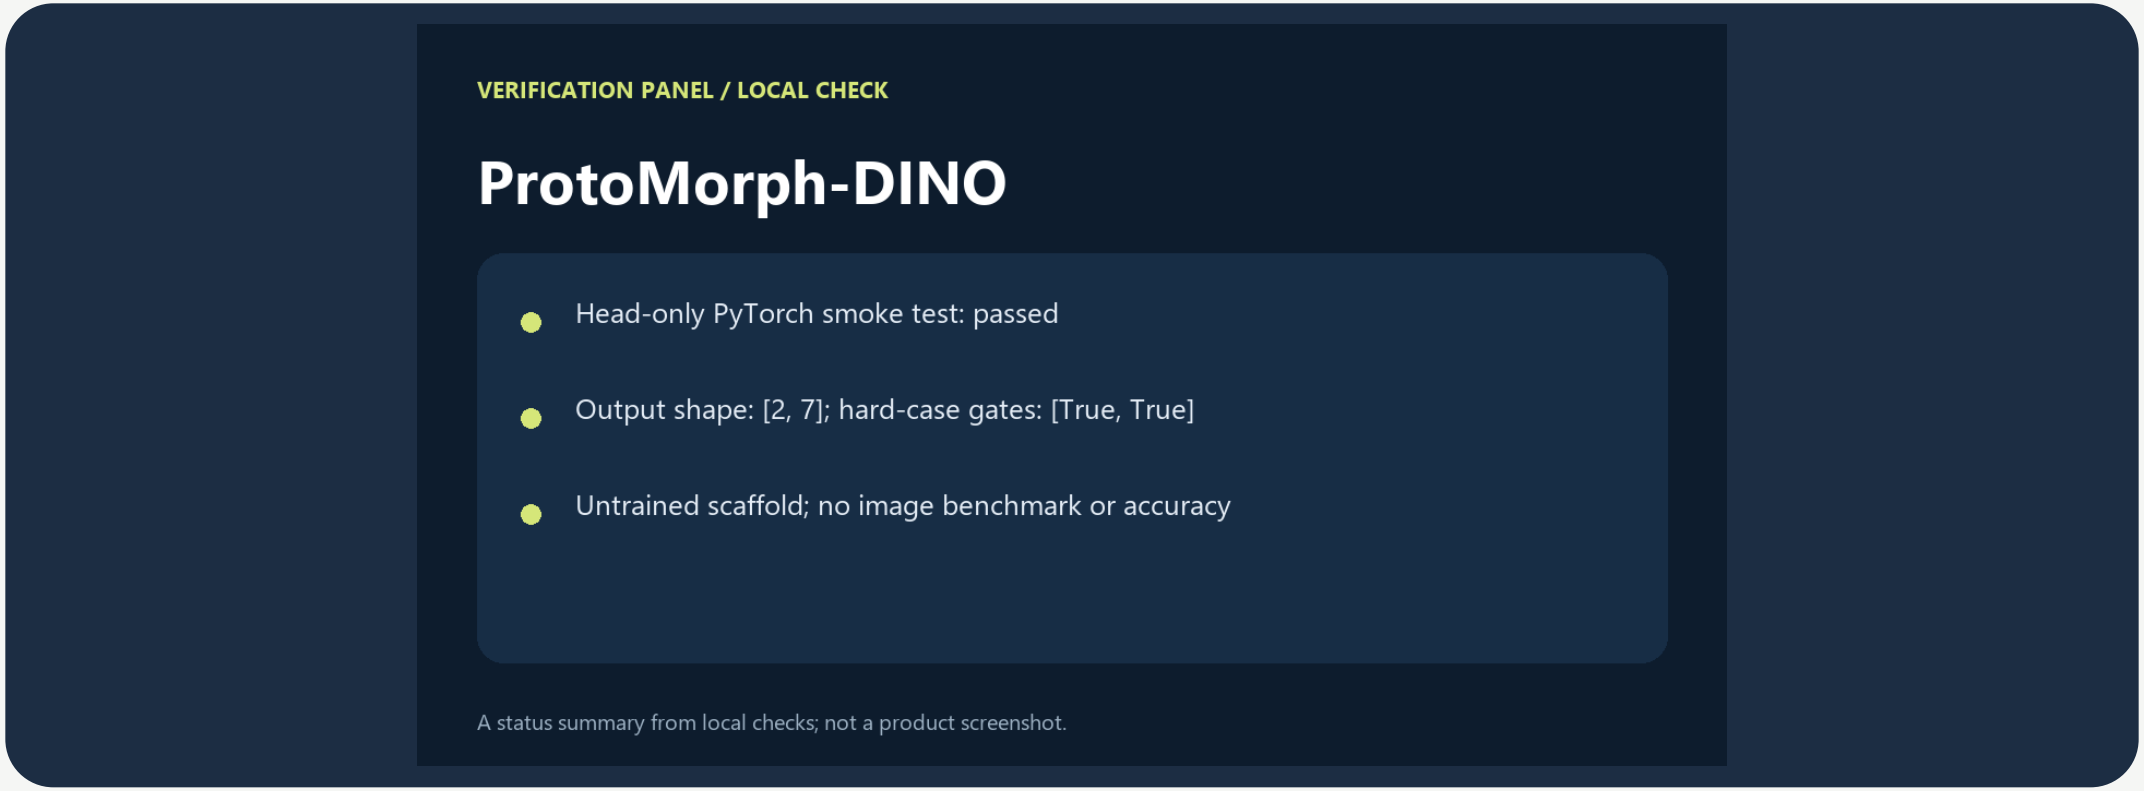

FEATURES

- Frozen DINOv3 backbone design
- Hard-case feedback routing
- Prototype and memory attention

TECH STACK

PyTorch / DINOv3 / Computer Vision

ProtoMorph-DINO

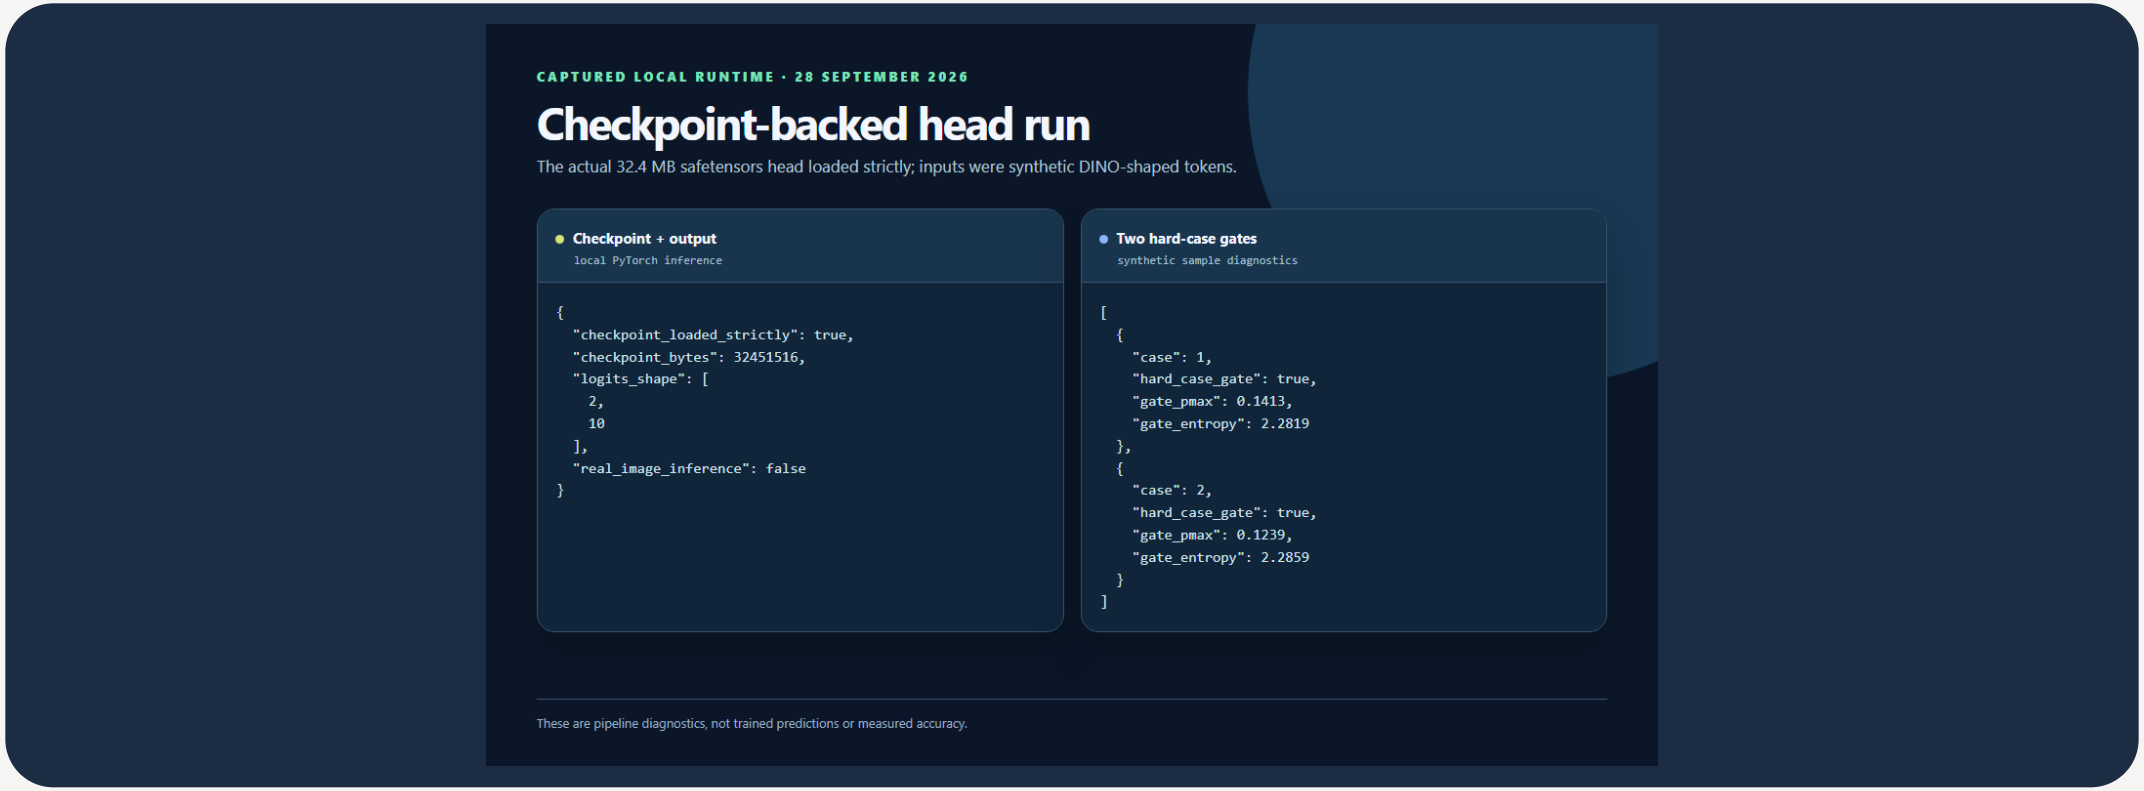

Synthetic head-only smoke check

Runtime scope is stated in each caption and in the result slide.

Source: https://huggingface.co/shiowo/DINO-Protomorph

ProtoMorph-DINO

Real head checkpoint; synthetic token diagnostics

Runtime scope is stated in each caption and in the result slide.

Source: https://huggingface.co/shiowo/DINO-Protomorph

ProtoMorph-DINO

VERIFIED OUTCOME

Python sources compiled and the head-only smoke test passed. The 32.4 MB safetensors checkpoint loaded strictly into the configured 10-class head and produced logits [2, 10] from synthetic DINO-shaped tokens. No DINOv3 backbone, real image inference, trained accuracy or benchmark was demonstrated.

LOCAL CHECK

RUN: Actual head checkpoint loaded and returned [2, 10] logits on synthetic tokens; separate smoke test passed. No trained image inference or benchmark.
