Voucher / Promo

Checkout-safe voucher microservice

JAVA SPRING BOOT MYSQL

THE IDEA

Voucher eligibility, claims and quota in one service.

Voucher-promo repository contributor (team project)

PROJECT BRIEF / 02

Voucher / Promo

WHAT THE PROJECT DOES

Voucher eligibility, claims and quota in one service.

THE PROBLEM

Checkout needs consistent validation and a way to prevent voucher quota from being consumed twice under concurrent requests.

CREDIT / ROLE

Haekal Alexander Dinova. Voucher-promo repository contributor (team project)

Repository snapshot c7cfb46

SOLUTION & STACK / 02

Voucher / Promo

HOW IT WORKS

The repository implements active-voucher listing, internal validation/claim endpoints and admin setup. Its service layer centralizes voucher policy, transactions, idempotency and locked quota updates.

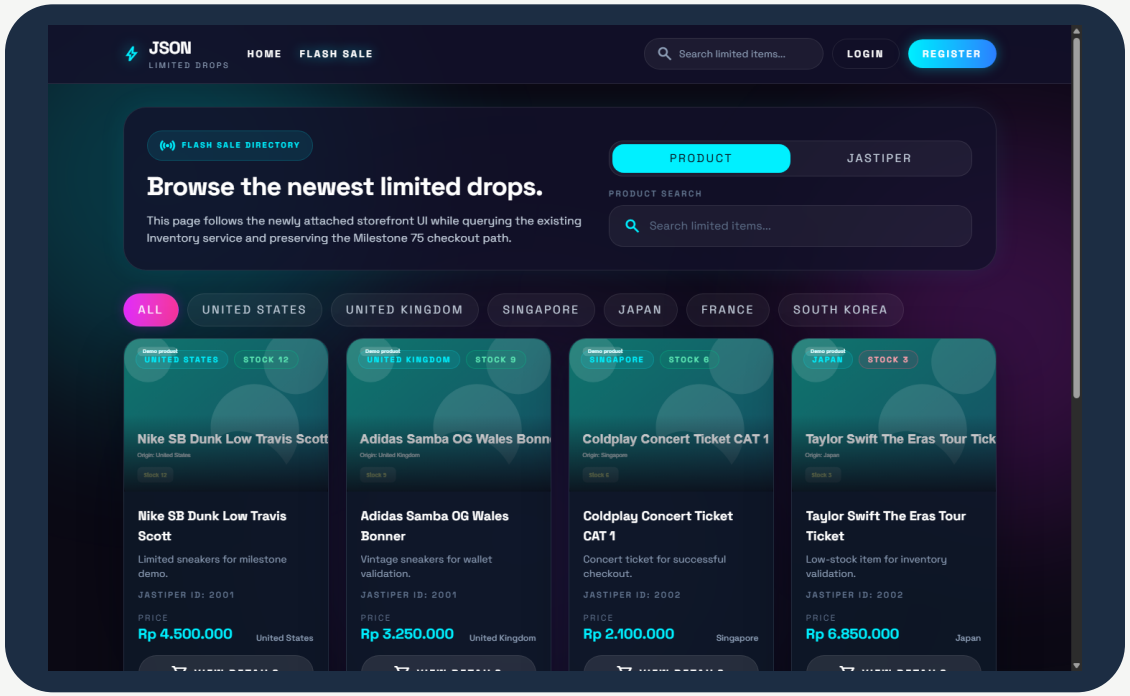

FEATURES

- Validate and claim endpoints
- Pessimistic write lock for quota
- Internal/admin token boundaries

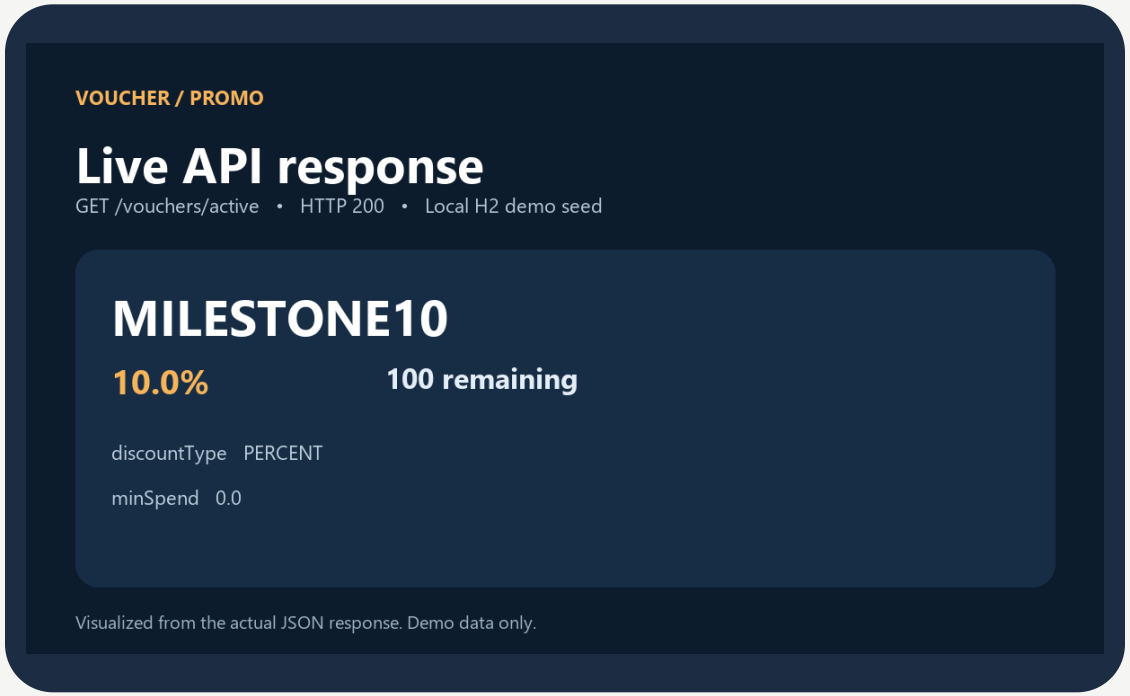

TECH STACK

Java / Spring Boot / MySQL

Voucher / Promo

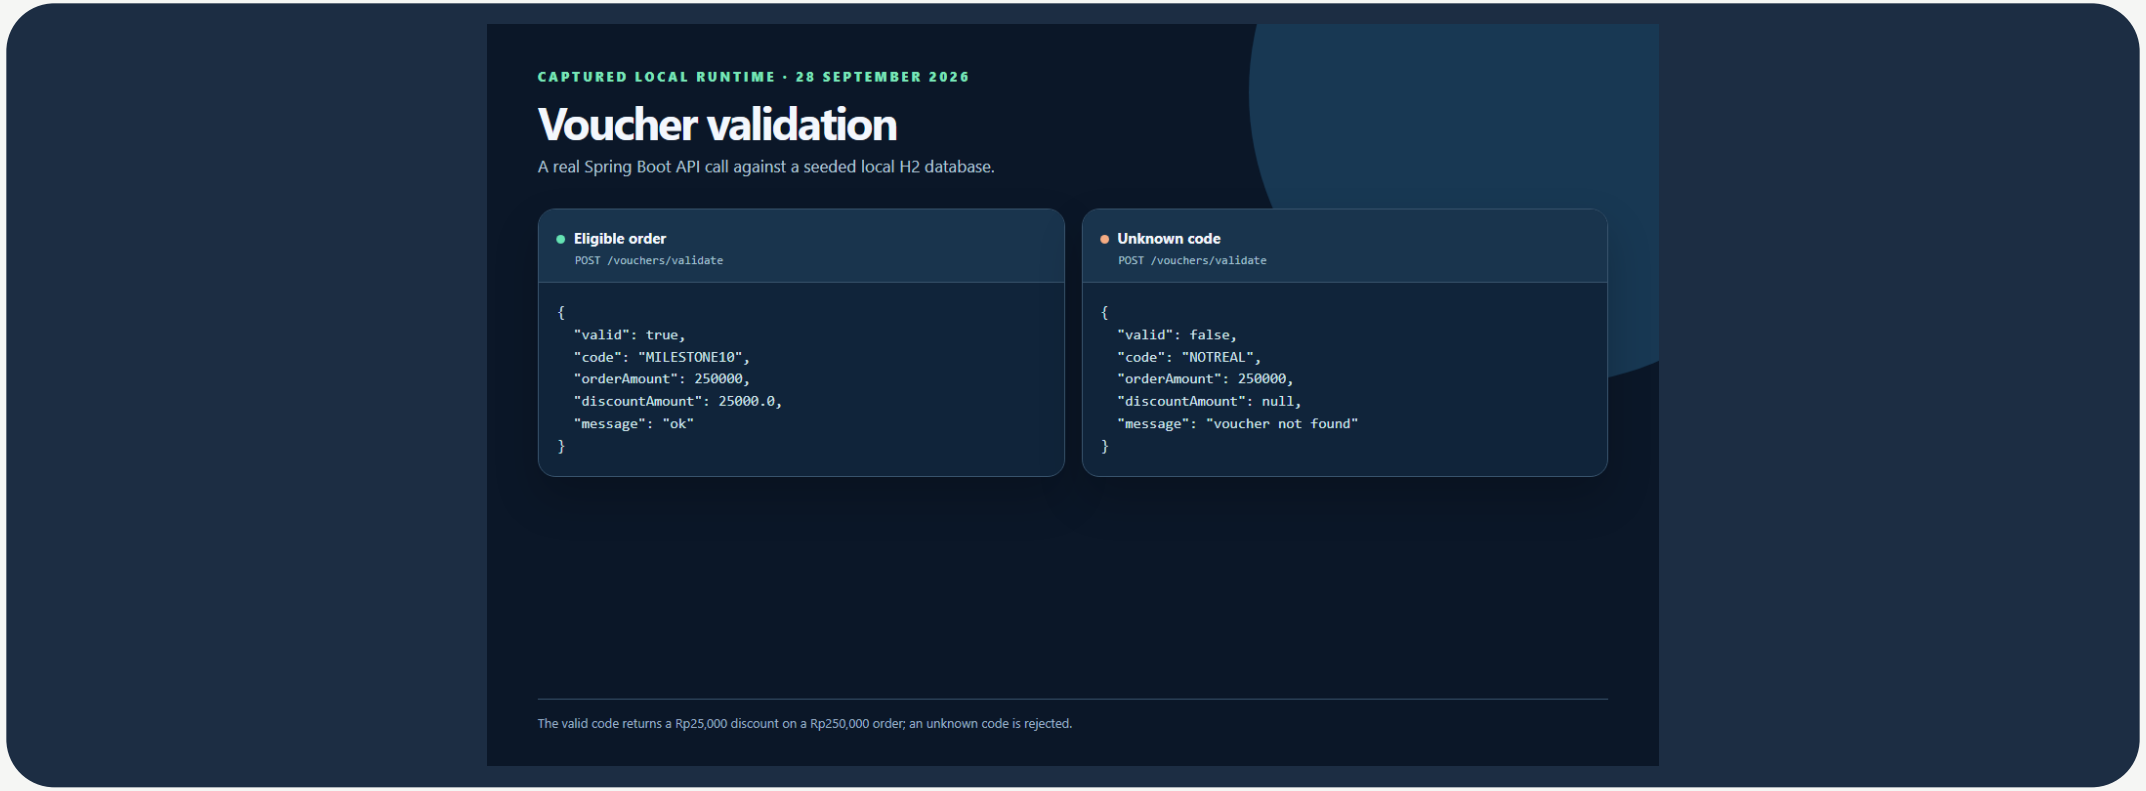

Marketplace catalog with live Inventory

Seeded active voucher response

Voucher / Promo

Live eligible and unknown-code validation

Source: https://github.com/advprog-2026-A04-project/Voucher-Promo

Voucher / Promo

Live first and repeated claim

Source: https://github.com/advprog-2026-A04-project/Voucher-Promo

RESULT & HANDOFF / 02

Voucher / Promo

VERIFIED OUTCOME

The backend compiled and 37 focused policy/service tests passed. A local H2 run returned an active MILESTONE10 voucher, a valid discount, an invalid-code rejection and an idempotent repeated claim. JSON frontend plus Inventory, Auth/Profile, Wallet and Order also ran locally.

LOCAL CHECK

RUN: active, validate and claim endpoints responded locally; repeated order ID did not consume another quota unit. 37 focused tests passed. H2 demo, not MySQL.
